## NON-TITLE V PERMIT APPLICATION INSTRUCTIONS INCINERATOR SOURCE DESCRIPTION FORM (APC 103)

This form should be completed for all new permit applications and all renewals where source conditions have changed since the previous application. This form should be used for all incinerators instead of the more general Process or Fuel Burning Source Description form (APC 102), and the Emission Point Description form (APC 101).

If any of the information requested is considered confidential, two application forms should be submitted, along with the Confidential Information Request form. One application form must be clearly marked to indicate that it contains confidential information, which is not to be made public and another application form, which does not contain the confidential information and can be placed in our general files. Emission data normally cannot be treated as confidential by the Division. Please contact the APC Division if there are any questions concerning confidentiality of information. The Confidential Information Request form can be found on the Division's website at: <a href="http://tn.gov/environment/article/permit-air-other-information">http://tn.gov/environment/article/permit-air-other-information</a>.

The Tennessee Air Pollution Control Division prefers that application forms be submitted via email to the email address <u>Air.Pollution.Control@TN.gov</u>. All application forms should be scanned/combined into one PDF document and sent as an attachment to the email. If email is not available, then application forms can be mailed to the address on the form.

The items below give a brief explanation of the information being requested on the form. The following numbers refer to the specific box on the form:

- The organization's legal name is the name under which the company is registered with the Tennessee Secretary of State (SOS). The organization's legal name and SOS control number can be found on the SOS website at <u>https://tnbear.tn.gov/Ecommerce/FilingSearch.aspx</u>. If the organization is not registered with the SOS, then the owner's name must be listed.
- **2.** The Emission Source Reference Number(s) will be assigned by the Tennessee Air Pollution Control Division. It is an eight digit number in the following format NN-NNN-NN.
- Check "Yes" or "No" depending on whether the air contaminant source is subject to an NSPS rule (New Source Performance Standards) or NESHAP rule (National Emission Standard for Hazardous Air Pollutants). List the rule citation, including Part, Subpart, and applicable Sections. For example, a boiler may be subject to 40 CFR Part 60 Subpart Dc and sections §60.42c, §60.42c, §60.46c, §60.47c, and §60.48c.
- **4.** Show the type of waste burned by entering the code number found on the last page of this form (APC 103), which most nearly describes the material incinerated. Show the average and design charging rates and the approximate tons per year of waste burned.
- **5.** Indicate the incinerator manufacturer, model number, and date installed.
- **6.** Indicate the incinerator type by checking the appropriate boxes.
- **7.** Enter the design capacity of all auxiliary fuel burners. Enter the approximate overfire and underfire air flow in cubic feet per minute (CFM), if applicable. Also indicate if the incinerator is designed to limit and control the amount of air to the primary chamber.
- **8.** List the type of primary auxiliary fuel used and the type of standby auxiliary fuel used, if applicable. Complete the table showing the annual and hourly usage of all auxiliary fuels.

- **9.** Enter operating parameters relating to stack emissions or exhaust points (hoods, exhaust fans, etc.). Data for flow, velocity and moisture should be entered for actual conditions and flow for standard conditions. Standard temperature is defined as 68°F for sources subject to New Source Performance Standards (NSPS), 60°F for sources subject to diffusion equation based emission standards, and 70 °F for the rest of sources. Standard pressure is defined as 14.696 psia (1 atm). Dry conditions are defined as zero percent moisture.
- **10.** Emission estimates for each pollutant emitted from this source should be based on stack sampling results or engineering calculations. In certain cases, other estimates may be accepted. Calculations should be attached on a separate sheet. Full details regarding the calculation method and emission factors used should be included. For example:
  - (1) If U.S. EPA's Compilation of Air Emission Factors (AP-42) is used, submit the version, chapter, table, equation, etc. AP-42 can be found on the U.S. EPA's website: <u>https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emission-factors</u>.
  - (2) Attach sample calculations and fully explain any assumptions, bottlenecks, etc.
  - (3) Submit any supporting information such as manufacturer's data or safety data sheets (SDS).
  - (4) If the emissions are from a source test, provide details on the source test such as the date of the test, was the test approved by the Department, etc. If the source test was not approved by the Department, submit the test details and results.
  - (5) If multiple fuels are used, use the worst case fuel to calculate emissions for each pollutant, and list the fuel in the calculation method details. Include the percent sulfur in the fuel and the BTU content of fuel, when appropriate.

Average emissions (lbs./hr.) should be representative of the following: (1) For continuous or long-run, steady-state, operations it is the total weight of pollutant emitted to the atmosphere for the entire period of continuous operation or for a typical portion thereof divided by the number of hours of such period or portion thereof; (2) for cyclical or batch type operation, it is the total weight of the pollutant emitted to the atmosphere for a period which covers a complete or an integral number of cycles divided by the hours of actual process operation during such periods.

Maximum emissions (lbs./hr.) should be determined by dividing the total highest emissions possible during any 3 hour period with control equipment working properly, by 3. This will be dependent upon such things, either singly or in combination, as maximum possible operating rate, a particular input material, product, or fuel which may result in increased emissions; periods of highest emissions for cyclical or batch type operations, etc. Concentrations should be determined for stack emissions only and should reflect average exit gas concentrations reported in the units specified on the form.

Average emissions (ton/yr) should be calculated by multiplying the average emissions (lb/hr) by the normal operating hours (hr/yr) and converting the units from pounds (lb) to tons.

Potential emissions (ton/yr) or "Potential to emit" means the maximum capacity of a source to emit an air contaminant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit an air contaminant, including air contaminant control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design only if the limitation or the effect it would have on emissions is "legally enforceable." Secondary emissions do not count in determining the "potential to emit" of a source.

Emission estimation method code and control device descriptions, along with corresponding codes, can be found on the last page of these instructions. The codes which most accurately describe the estimation methods and control equipment should be used; along with the estimated control equipment efficiency for each pollutant present. Any estimation methods of control devices other than those listed in the tables should be described in the comments section.

Some hazardous air pollutants (HAPs) are considered both a HAP and an organic compound. Include these HAPs when determining organic compound totals. If necessary, additional HAPs can be listed in the Other (specify) areas or attached as an additional sheet.

- **11.** Include a description and the operating parameters of any control devices. Examples include bag house pressure drop, scrubber flow rate and pH of flow, temperature of thermal oxidizer, how often fabric filters are changed, etc. Typically this information can be found in the operating manual for the control device. If the control device is covered by a federal regulation, it is acceptable to cite the applicable section(s) of the federal regulation.
- **12.** If a wet scrubber is used to control emissions, enter the manufacturer and model number, water flow (in gallons per minute), and scrubber pressure drop (in inches of water)
- **13.** If there is a monitoring device and/or recording instrument associated with the emission source, indicate what type or include a description in the comment box.
- **14.** Include any comments in the space provided.
- **15.** If this form is being submitted at the same time as an APC 100 form, then a signature is not required on this form. Date this form regardless of whether a signature is provided. If this form is NOT being submitted at the same time as an APC 100 form, then a signature is required. Applications should be signed by the responsible person listed in Item 7 of the APC 100 form.

## **Table of Pollution Control Device and Method Codes**

**Note**: For cyclones, settling chambers, wet scrubbers, and electrostatic precipitators; the efficiency ranges correspond to the following percentages:

High: 95-99+%. Medium: 80-95%

And Low: Less than 80%.

If the system has several pieces of connected control equipment, indicate the sequence. For example: 008, 010 If none of the below codes fit, use 999 as a code for other and specify in the comments.
